Ms excel formulas pdf in tamil language pdf file downloads

You may have a list of multiple contacts in a company and only want to see the number of companies you have. Filters allow you to pare down your data to only look at certain rows at one time. Rather than writing words into your sheet repetitively, such as "Yes", "No", "Customer Stage", "Sales Lead", or "Prospect", you can use dropdown menus to quickly mark descriptive things about your contacts or whatever you're tracking. Addition: To add the values of two or more cells, use the + sign. In our example, this is "Sheet2!A:B." "A" means Column A in Sheet 2, which is the column in Sheet 2 where the data identical to our lookup value (email) in Sheet 1 is listed. But, if you have to hyperlink words, such as a page title or the headline of a post you're tracking, here's how. If you want to color code commonalities between different rows in Excel, you can do that. It removes the need to spend hours and hours counting cells or copying and pasting performance numbers. Excel can do it. Lookup Value: This is the column in Sheet 1 that contains identical values in both spreadsheets. Keep in mind that VLOOKUP will only pull back values from the second sheet that are to the right of the column containing your identical data. If the "A" is on top of the "Z," you can just click on that button once. The formula: =VLOOKUP(lookup value, table array, column number, Approximate match (TRUE) or Exact match (FALSE)) The formula with variables from our example below: =VLOOKUP(C2,Sheet2!A:B,2,FALSE) In this formula, there are several variables. Use conditional formatting to make cells automatically change color based on data. Select the cells you want to be the source, locate the fill handle in the lower-right corner of the cell, and either drag the fill handle to cover cells you want to fill or just double click: Similarly, sorting is an important feature you'll want to know when organizing your data in Excel. Sometimes you may have a list of data that has no organization whatsoever. In my Harry Potter example, let's say I only want to see the students in Gryffindor. Writing and formatting column text and titles. [Note: Your range can be more than two columns. When used in a formula, it isn't representing an American dollar; instead, it makes sure that the exact column and row are held the same even if you copy the same formula in adjacent rows. (Below, we'll get into how to add things like multiple columns and rows.) Keeping column and row titles visible as you scroll past them in a spreadsheet, so that you know what data you're filling as you move further down the document. When you're happy with the preview, press "Next." This page will allow you to select Advanced Formats if you choose to. 9. Check that box and select OK. Keep in mind that you can use plain numbers in your formulas. However, if we made it (10+10)*10, the first and second 10 would be added together first. The syntax is: COUNTIF(range, criteria). Value_if_True: This is what we want the cell to show if the value is true. The following is true when you want to combine information in Sheet 1 and Sheet 2 onto Sheet 1. First, highlight the column that you want to split up. Sometimes, you'll be using your spreadsheet to track processes or other qualitative things. To add that necessary space, use the function =A2&" "&B2. When you're done, click "Finish." 7. Like VLOOKUP, the INDEX and MATCH functions pull in data from another dataset into one central location. Pro Tip: Copy and paste the values in the spreadsheet when a Filter is on to do additional analysis in another spreadsheet. This Excel for beginners course will help you learn Excel basics. 14. This can be tedious with large datasets and/or lead to errors. Then, it's time to choose the Delimiters. Alternatives include Google Sheets and Numbers. Find more Excel alternatives here. But first, let's take a look at the types of documents you can create using the software. You see, a cell reference — when you refer to cell A5 from cell C5, for example — is relative by default. When you have rows of data in your spreadsheet, you might decide you actually want to transform the items in one of those rows into columns (or vice versa). If you use TRUE, the function will pull in approximate matches. Use Pivot tables to recognize and make sense of data. 10. You can also use this feature to remove an entire row based on a duplicate column value. Sometimes, you may even need to add hundreds of rows. As you play around with your data, you might find you're constantly needing to add more rows and columns. You may be thinking that I don't have too much data, but for longer data sets, this will come in handy. Add checkboxes. Excel Functions Excel functions automate some of the tasks you would use in a typical formula. Then, under FORM CONTROLS, click the checkbox or the selection circle highlighted in the image below. The formula is: IF(logical_test, value_if_true, [value_if_false]) Example Shown Below: =IF(D2="Gryffindor","10","0") In general terms, the formula would be IF(Logical Test, value of true, value of false). Here's how that looks in practice: =IF(B3 Pivot Table. Select "Remove Duplicates," and you're good to go. In situations like this, removing the duplicates comes in quite handy. For example, instead of having a column that shows a person's full name, a database might have the data as a first name and then a last name in separate columns. So if you have three rows with Harry Potter's information and you only need to see one, then you can select the whole dataset and then remove duplicates based on email. (And to all the Harry Potter fans out there ... A pop-up will appear to confirm which data you want to work with. Microsoft Excel is powerful data visualization and analysis software, which uses spreadsheets to store, organize, and track data sets with formulas and functions. The INDEX and MATCH formulas work right-to-left, whereas VLOOKUP formulas only work as a left-to-right lookup. The formula is actually the MATCH formula nested inside the INDEX formula. The syntax is as follows: INDEX(array, row_num, [column_num]). With Excel, they can easily make sense of their business' data. Sometimes, we don't want to count the number of times a value appears. Here is a list of documents you can create: Income Statements: You can use an Excel spreadsheet to track a company's sales activity and financial health. So: Sheet2!C:C. This lets you quickly fill adjacent cells with several types of data, including values, series, and formulas. Editor's Note: This post was originally published in August 2017 but has been updated for comprehensiveness. Doing this one-by-one would be super tedious. But if you ever spent some time formatting a sheet to your liking, you know it can get a bit tedious. There are multiple ways to deploy this feature, but the fill handle is among the easiest. I'd use the INDEX and MATCH formulas instead of VLOOKUP so I wouldn't have to switch any columns around. Let's say we want to combine both datasets so that all the house information from Sheet 2 translates over to Sheet 1. For example, you can categorize data into values that are less than 10, 11 to 50, or 51 to 100. From there a box will pop up allowing you to place the hyperlink URL. It would take a lot of time to copy and paste each individual header — but what the transpose feature allows you to do is simply move your row data into columns, or the other way around. 11. No advanced Excel knowledge required. You'll often find the software in accounting offices and teams because it allows accountants to automatically see sums, averages, and totals. However, when the "Z" is on top of the "A," that means your list will be sorted in reverse alphabetical order. 13. Check the In-Cell dropdown button, then press OK. So when we type in the formula =VLOOKUP(C2,Sheet2!A:B,2,FALSE), we bring all the house data into Sheet 1. Scour your data sets to make sure the column of data you're using to combine your information is exactly the same, including no extra spaces. To make this true for multiple rows, simply drag the corner of that first cell downward as shown in the example. Choose the first value in your first spreadsheet. Need to merge two sheets with similar data? 16. Lookup Array: This is the column in Sheet 2 that contains identical values in both spreadsheets. 1. The formula: =COUNTIF(range, criteria) The formula with variables from our example below: =COUNTIF(D:D,"Gryffindor") In this formula, there are several variables: Range: The range that we want the formula to cover. Note: In the example above, I awarded 10 points to everyone in Gryffindor. By highlighting three rows and then clicking insert, I'm able to add an additional three blank rows into my spreadsheet quickly and easily. In Excel, you can combine cells with different data into one cell by using the "&" sign in your function. Adding or deleting single columns, rows, and spreadsheets. Example: =VLOOKUP([@Attorney],tbl_Attorneys,4,FALSE). In our example, this would be the column that "House" is located in. Add more than one row or column. Remove duplicate data points or sets. If you want to sum up a column of numbers, you can use the formula =SUM(Cell1:Cell2). IF: The IF function allows you to return values based on a logical test. Let's take a look at the example below. In this case, we want the cell to show "10" to indicate that the student was awarded the 10 points. The formula: =INDEX(table array, MATCH formula) This becomes: =INDEX(table array, MATCH (lookup_value, lookup_array)) The formula with variables from our example below: =INDEX(Sheet2!A:A,(MATCH(Sheet1!C:C,Sheet2!C:C,0))) Here are the variables: Table Array: The range of columns on Sheet 2 containing the new data you want to bring over to Sheet 1. If the "Z" is on top of the "A," click on the button twice. Okay, ready to get into the nitty-gritty? Right-click on the cell, and then select "Paste Special." A module will appear — at the bottom, you'll see an option to transpose. Ranges are one way to segment your data for better analysis. SUM: The SUM function automatically adds up a range of cells or numbers. Add a filter by clicking the Data tab and selecting "Filter." Clicking the arrow next to the column headers and you'll be able to choose whether you want your data to be organized in ascending or descending order, as well as which specific rows you want to show. Use formulas for simple calculations. you're welcome in advance.) Note: The GIFs and visuals are from a previous version of Excel. That way, you have an overarching understanding of how you can use Excel in your day-to-day. Documents You Can Create in Excel Not sure how you can actually use Excel in your team? Division: To divide the values of two or more cells, use the / sign. 19. Hyperlink a cell to a website. Equal sign: Before creating any formula, you'll need to write an equal sign (=) in the cell where you want the result to appear. Your resulting list will have only unique names without any duplicates. Then, choose "Conditional Formatting" from the Home menu and select your logic from the dropdown. But you're not finished — if all you type in is =A2&B2, then there will not be a space between the person's first name and last name. By selecting the Gryffindor filter, the other rows disappear. Lookup Value: This is the identical value you have in both spreadsheets. In the example that follows, this means the "email" column on Sheet 1, which is Column C. Need to combine information in multiple cells? To add, use the + sign. This could be a tab, semi-colon, comma, space, or something else. If I were looking at columns C and D, I would use "C:D." Criteria: Whatever number or piece of text you want Excel to count. To subtract, use the - sign. 3. Or perhaps you want to separate someone's full name into a first and last name for your email marketing templates. Example: =C5-D3. For example, if you want to flag certain numbers that are above average or in the top 10% of the data in your spreadsheet, you can do that. Databases tend to split out data to make it as exact as possible. To remove your duplicates, highlight the row or column that you want to remove duplicates of. 2. Here's what that looks like: SUM(Cell1:Cell2). To complete a sum, you would input the starting cell and the final cell with a colon in between. While Excel is primarily known as an accounting tool, professionals in any field can use its features and formulas — especially marketers — because it can be used for tracking any type of data. To change the relative formula (=A5+C5) into an absolute formula, we'd precede the row and column values by dollar signs, like this: (=$A$5+$C$5). In the example that follows, this means the first email address on the list, or cell 2 (C2). Larger data sets tend to have duplicate content. Split up text information between columns. In this case, the logic is D2="Gryffindor" because we want to make sure that the cell corresponding with the student says "Gryffindor." Make sure to put Gryffindor in quotation marks here. For example, if you're using an Excel sheet to manage your sales prospects and want to track whether you called them in the last quarter, you could have a "Called this quarter?" column and check off the cells in it when you've called the respective client. Instead of just pulling in any numeric value, you can sum, count, average, max, min, count numbers, or do a few other manipulations with your data. This is only a small sampling of the types of marketing and business documents you can create in Excel. 15. Instead of manually typing in 10's next to each Gryffindor student's name, I can use the IF Excel formula to say that if the student is in Gryffindor, then they should get ten points. (You can also create your own rule if you want something different.) A window will pop up that prompts you to provide more information about your formatting rule. So: Sheet1!C:C. To add multiple rows or columns in a spreadsheet, highlight the same number of preexisting rows or columns that you want to add. Then, go to the Data tab and select "Remove Duplicates" (which is under the Tools subheader in the older version of Excel). They won't change the data that you have, but they can sum up values and compare different information in your spreadsheet, depending on what you'd like them to do. The quotation marks around the space tell Excel to put a space in between the first and last name. You can also use parentheses to ensure certain calculations are done first. Excel will automatically populate your Pivot Table, but you can always change around the order of the data. Start by highlighting the column that you want to transpose into rows. Logical_Test: The logical test is the "IF" part of the statement. Row Labels: These could be your rows in the dataset. For example, if there are three columns on Sheet 2 — Email, Age, and House — and you still want to bring House onto Sheet 1, you can still use a VLOOKUP. If you're using the most recent version of Excel, you'd go to Insert > Pivot Table. That's where filters come in. Sorting your data in alphabetical order. Let's explore a few of these more in-depth. For instance, why does auto-fill matter? If you have any basic Excel knowledge, it's likely you already know this quick trick. In the example below (10+10*10), the second and third 10 were multiplied together before adding the additional 10. Your column will now be transferred to a row or vice-versa. The real power of the IF function comes when you string multiple IF statements together, or nest them. Example: =C5/D3. COUNTIF: The COUNTIF function returns the number of cells that meet a certain criteria or have a certain value. With the COUNTIF function, Excel can count the number of times a word or number appears in any range of cells. For example, maybe you want to pull out someone's company name through their email address. Next, we'd highlight one cell that contains a first name, type in an "&" sign, and then highlight a cell with the corresponding last name. Conditional formatting allows you to change a cell's color based on the information within the cell. Here's how to do it. Example: =(C5-D3)/((A5+B6)*3). Maybe you exported a list of your marketing contacts or blog posts. Using Excel's auto-fill features.
